

Virginia's natural resources are challenged and stressed by climate change. Many native species face invasive plants, insects and diseases that threaten their continued existence.

Therefore, the Garden Club of Virginia supports:

- Independent, academic, peer-reviewed scientific research of climate change phenomena
- Educational programs for members and the general public about the causes and consequences of climate change
- Individual and state-wide initiatives to control greenhouse gas emissions
- Individual and state-wide initiatives to protect the Chesapeake Bay and its tributaries
- Individual and state-wide initiatives to support sustainable forests to protect Virginia watersheds and promote clean air
- Legislative initiatives to address climate change
